Challenges and opportunities in the e-Navigation Development. Actual projects.

John Erik Hagen, Regional Director
Oslo, September 2018

– Vi tar ansvar for sjøvegen

What is e-navigation?

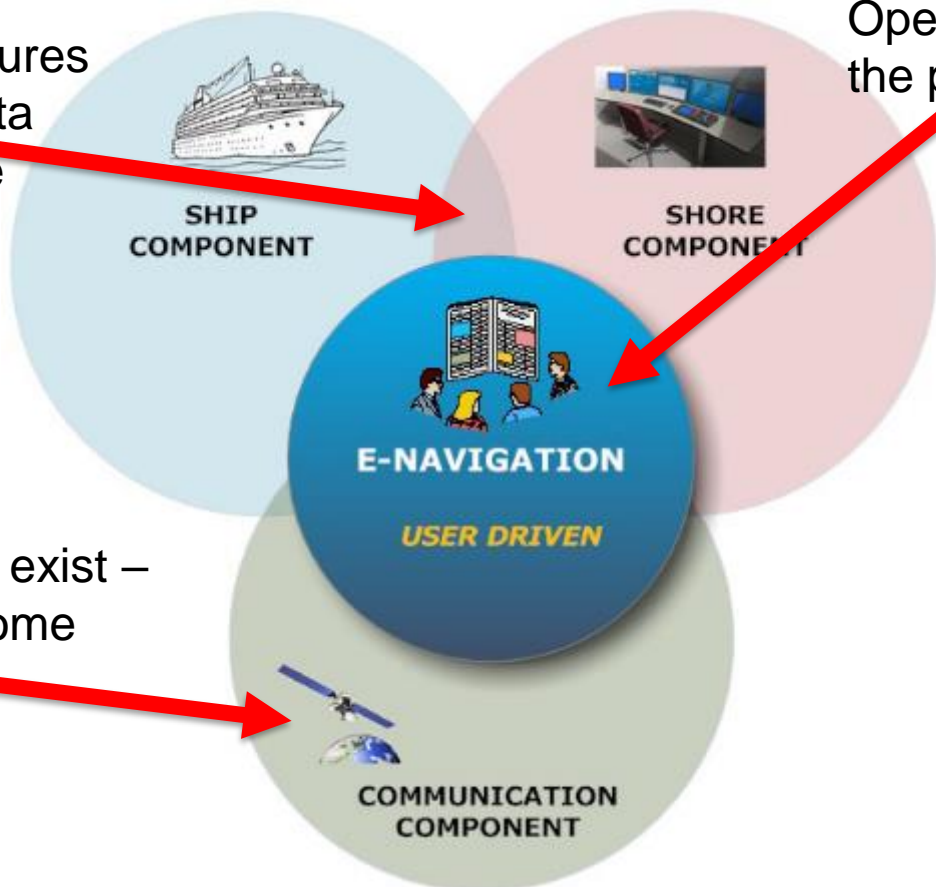

- Efficient transfer of marine information and data between all users on board and ashore, such as:
 - Automated ship reporting provided from ships to shore-based authorities
 - Digital maritime services sent from different stakeholders ashore to ships.
- Integrated information presented on graphical displays on the bridge, such as:
 - Enable easier access and use of important navigational information
 - Provide navigators with user-friendly bridge design and standardized mode of systems.

The purpose of e-navigation

- Prevent groundings and collisions by reducing human errors and strengthening safety and security for efficient marine traffic, thereby protecting the environment.
- Enhance services, systems and equipment that work for navigators and shore-based personnel, ensuring that their user needs continue to be met.
- Provides a structure that enable the maritime sector to continuously reap the benefits of digital advancements in today's rapid technological development.
- The e-Navigation development is a necessary step towards a sustainable platform for enhanced connectivity and smart infrastructure.

Remaining challenges in all key components should be solved in the future. E-Navigation opens up for new opportunities.

Framework, procedures and harmonized data language – the glue

Operational description – the platform

Several solutions exist – and new will become available

Test-beds in an holistic approach

Shipping @ digital inflection point

– Vi tar ansvar for sjøvegen

KYSTVERKET

Intelligent Systems and Data Analytics

The project shall prototype machine learning techniques to detect anomalies.

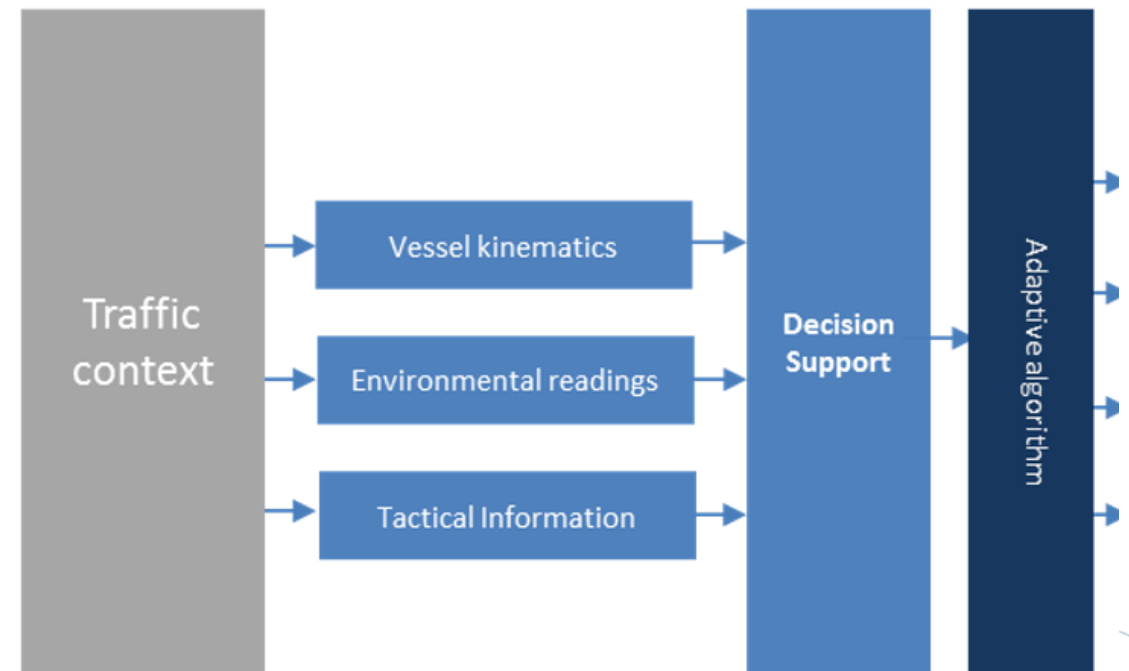

Including, but not limited to:

- Ships deviating from planned/reported route
- Ships deviating from leads/fairways
- Ships entering restricted areas
- Ships moving erratically (performing frequent or large turns)
- Ships undertaking unexpected or abnormal rendezvous
- Ships seemingly drifting without engine power
- Ships loitering/mooring outside recognized mooring areas
- Ships failing normal AIS-reporting within area of expected coverage
- Ships providing conflicting or inconsistent AIS-information

Situation

Sensors

Intelligence

SESAME Straits - objectives

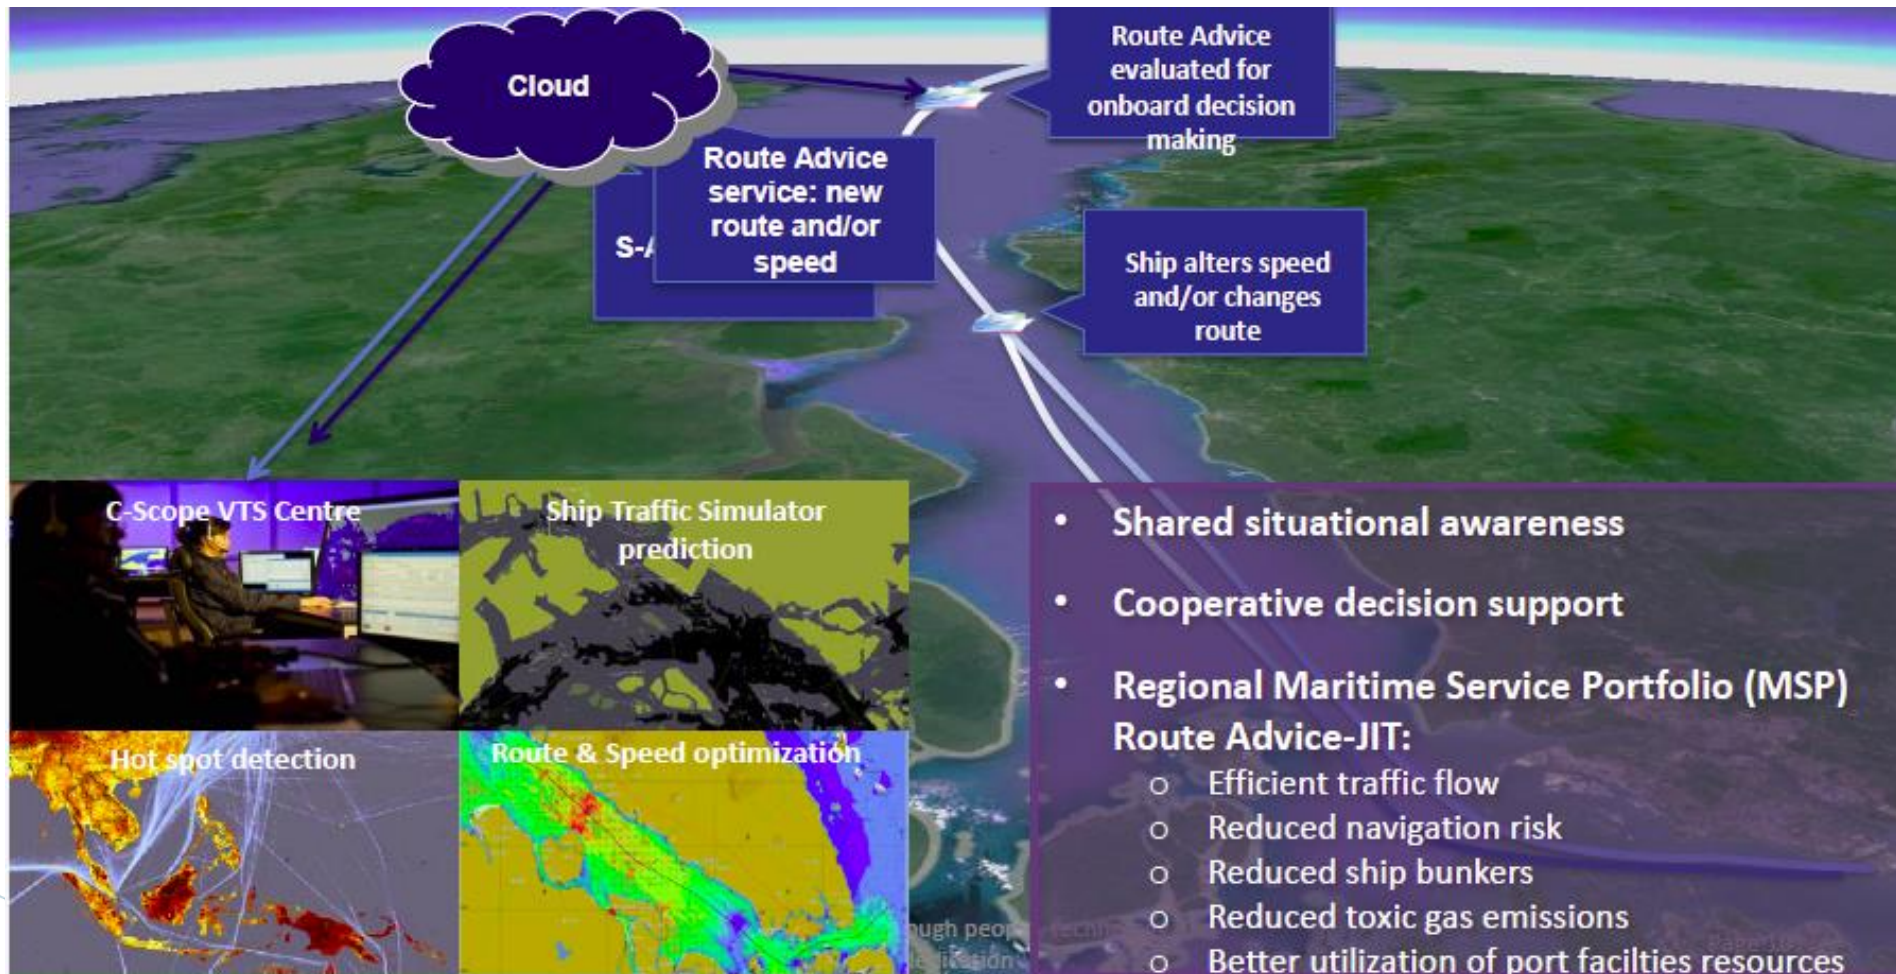

The primary objective is to **develop and validate** shared situational awareness and cooperative decision making between ship's bridge team and shore based Vessel Traffic Service (VTS) personnel.

Secondary objectives are:

- Just In Time arrival within a Regional Maritime Service Portfolio
- Use existing systems/equipment as far as possible

Operational Concept

– Vi tar ansvar for sjøvegen

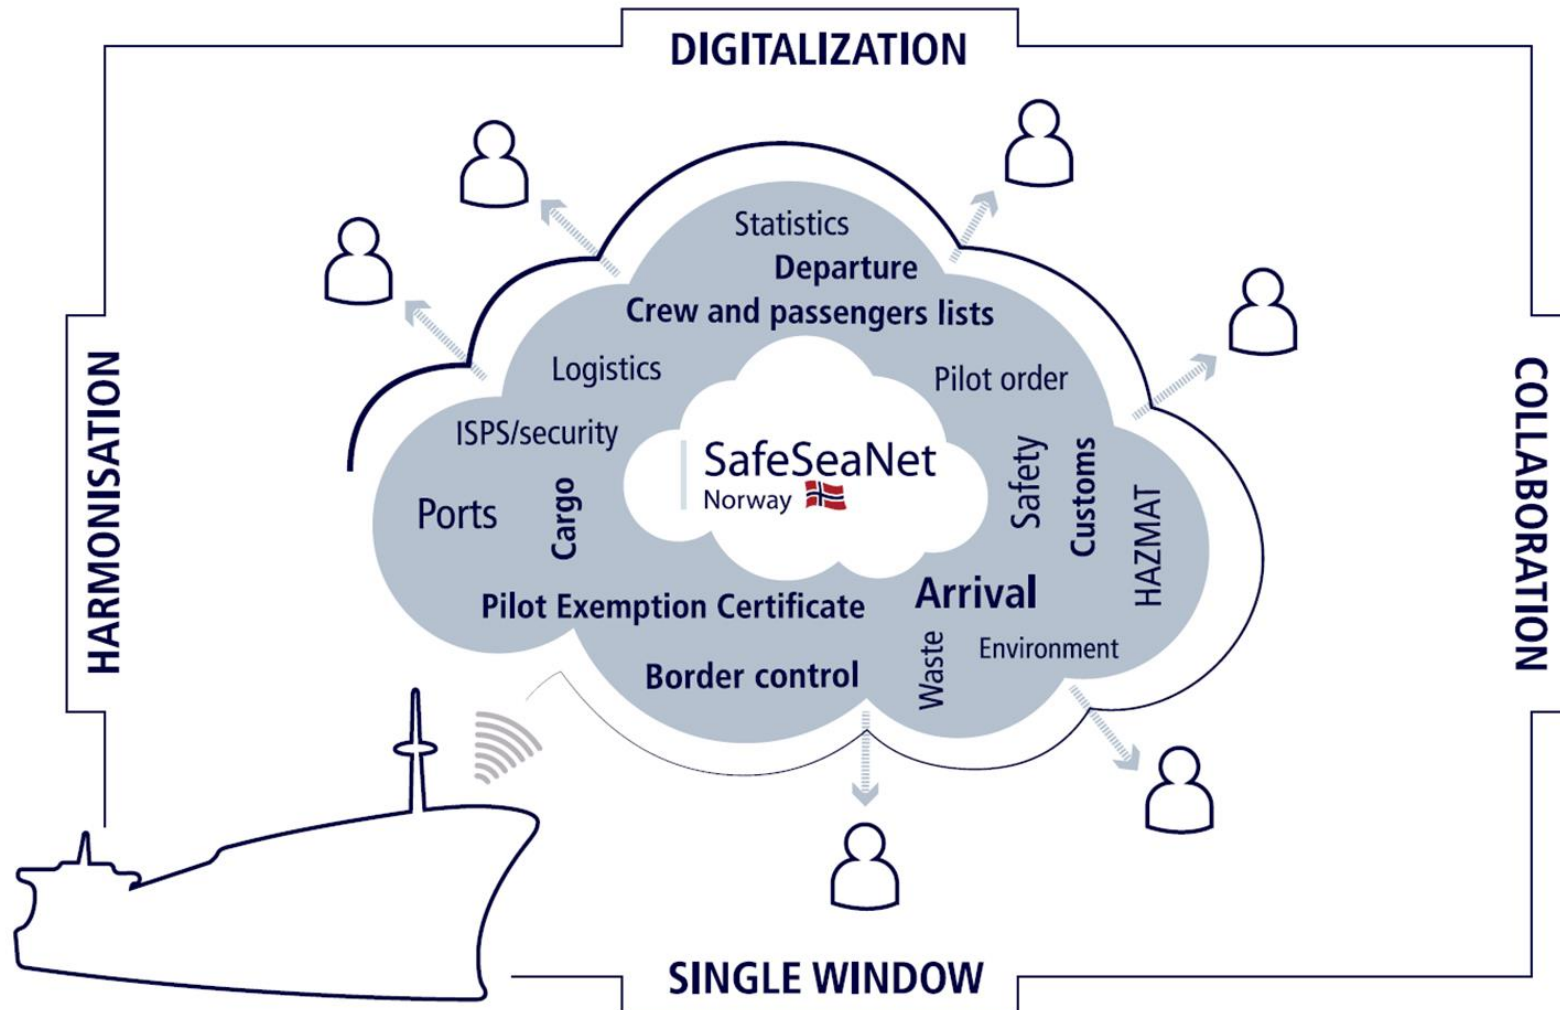

SESAME STRAITS – achievements

Functionality	On-board systems	Communication systems	On-shore systems
Route Exchange	Prototyped	Prototyped	Prototyped
Route Monitoring			Prototyped
Just-in-time			Prototyped
Live weather data	Operationalised		
Chart updates	Operationalised		
Nautical publications	Operationalised		
Hot spot detection	Prototyped	Prototyped	Prototyped
Enhanced alert service			Operationalised

SESAME Straits objectives were met, with e-navigation services test-bedded for the first time in real life environments

Smart and Innovative Infrastructure – the Norwegian Single Window Solution

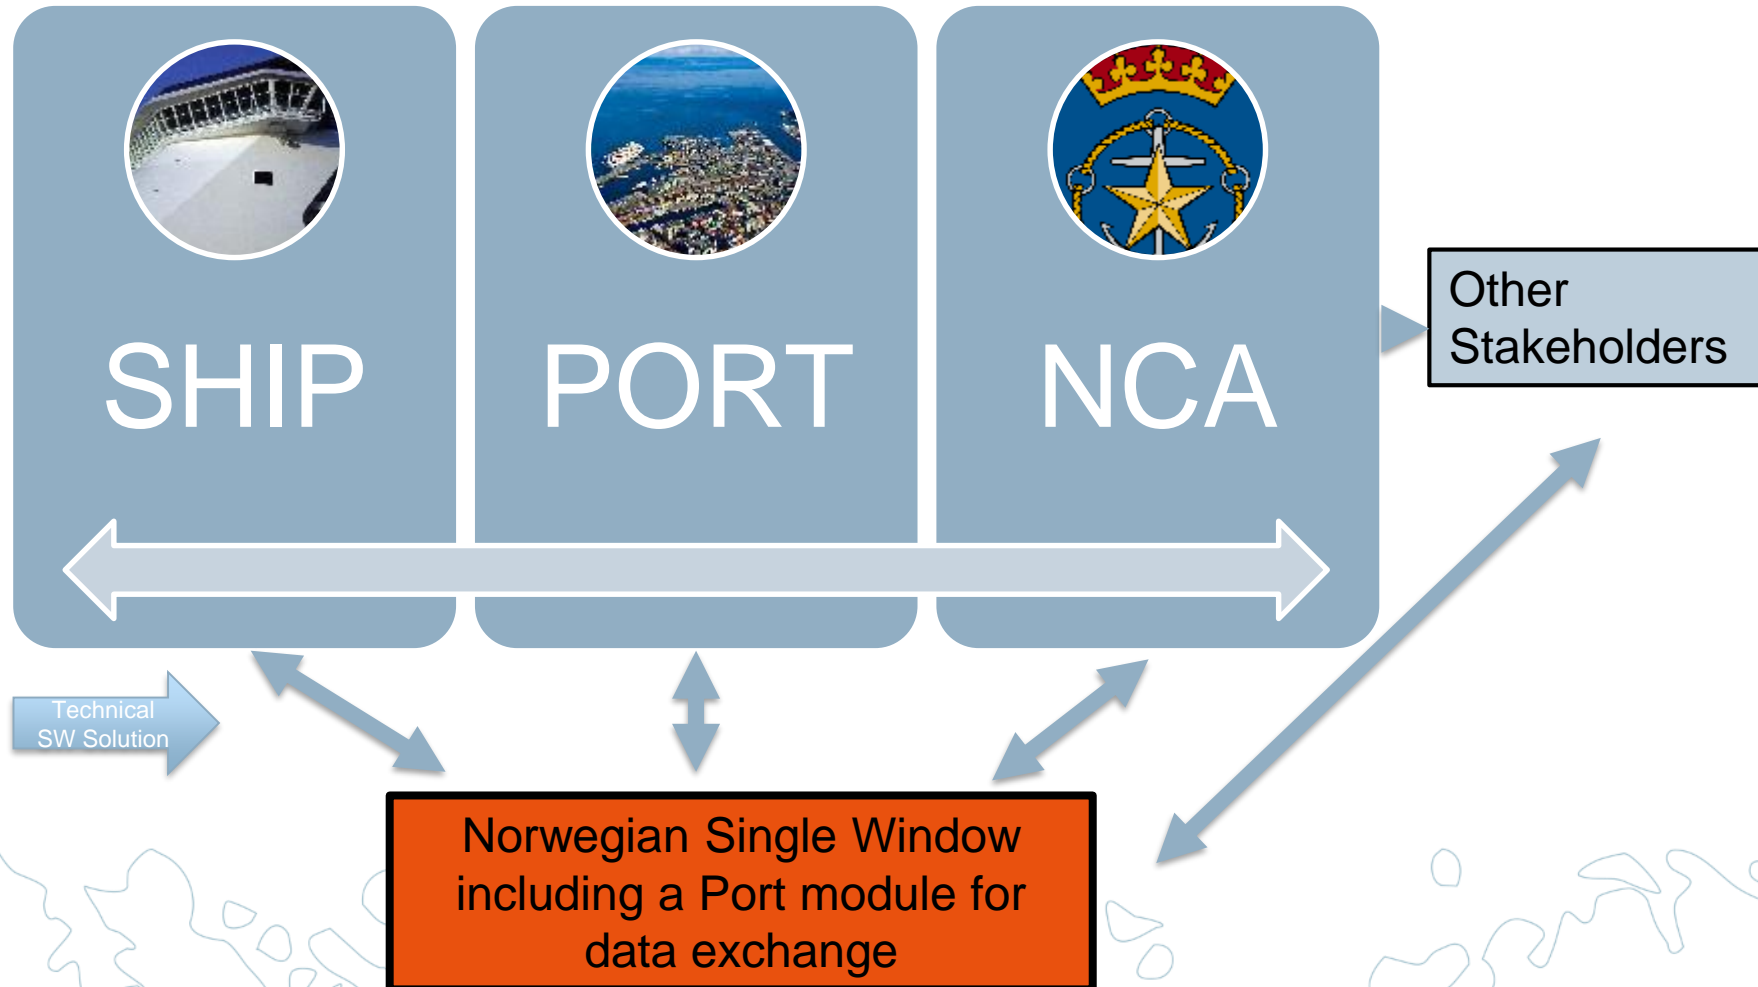

– Vi tar ansvar for sjøvegen

KYSTVERKET

Local port service from testbed to real service in the Norwegian SW solution

KYSTVERKET

E-navigation solution on ship reporting and maritime services

- IMO's e-Navigation solution on automated and standardized ship reporting consists of two integrated parts.
- The first part is the automatic collection of data on board and its preparation in the correct format for transmission to a Single Window application ashore.
- The second part is the distribution of the ships' information to the relevant shore parties via the Single Window solution, such as maritime authorities, customs, police, defense etc.
- These two parts are integrated by communications systems.
- The Norwegian SW approach includes IMO's e-Navigation solutions on ship reporting and Maritime Services

Safety and Security - e-Navigation test beds on port/VTS operations such as route exchange and MSI

– Vi tar ansvar for sjøvegen

KYSTVERKET

Digital voyage is already a reality, from 18th september 2018!

- Digital recommended sailing routes, to and from the port facilities
- Operational tool for planning and automatic information exchange during the voyage.
- Information exchange between web based GIS and graphical displays on board such as ECDIS.

GIS

ECDIS

Information technology

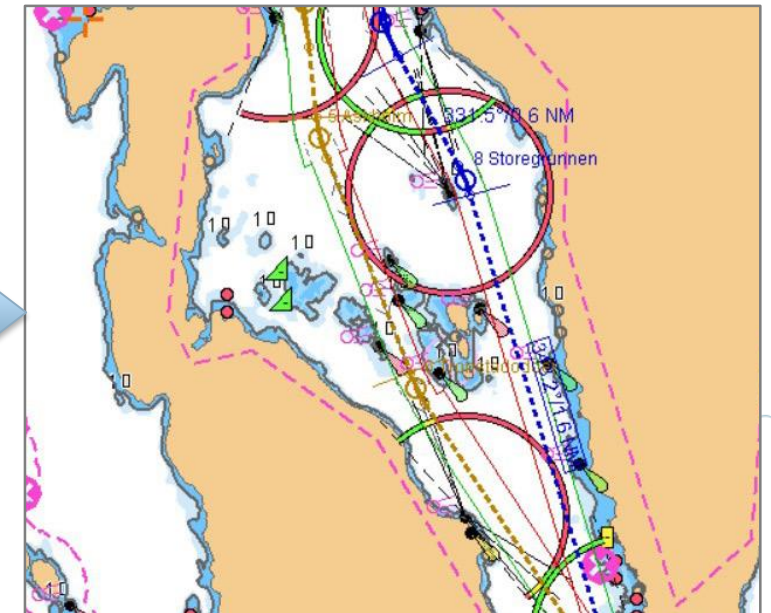

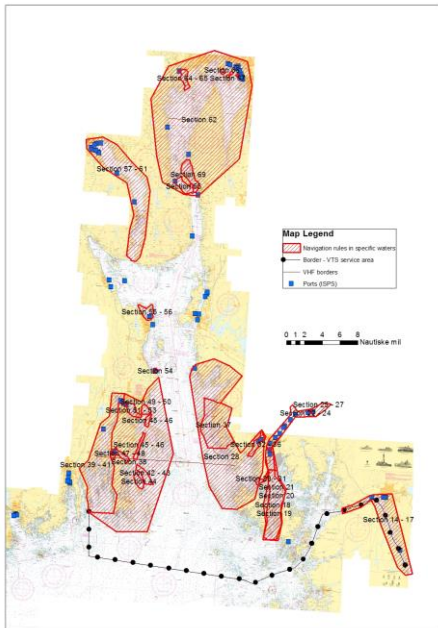

Information-management and tools in web-based Geographical Information Systems (GIS)

Operational technology

- Nautical information in Electronic Chart Display and Information System (ECDIS)

Route

(rtz and other international standards)

For fairways/corridors in **BLACK** – Class 1 certificate needed

Implementation of The Digital Voyage

Quality check and assurance of usability for operationalization

The NCA-representative and the captain (to the right) on board

Autonomous Systems and Robotics – NCA's legal and VTS approach

E-Navigation transfers shipping from analog to digital solutions, a necessary step towards automation and robotics.

– Vi tar ansvar for sjøvegen

KYSTVERKET

Conclusions

- E-navigation presents solutions for modern shipping on board and ashore, which are proven to be cost-effective and risk reducing.
- In order to ensure that we continue to keep ships safe at sea, the successful adoption of new technologies will depend on:
 - an effective regulatory framework, technical standardization on a global scale, automation where possible, and cooperation between all maritime stakeholders.
- The rapid technological development and digitalization of the maritime world is a fact, and e-navigation is highlighted as an important IMO plan to lead shipping into a new digital era.
